Design That Sets the Standard

Making complex mineral data feel clear, trustworthy, and human. A full UI design story from components to product.

OVERVIEW

The data was world-class. The experience to match it, wasn't.

Benchmark Mineral Intelligence is the world's leading price reporting agency and market intelligence platform for the lithium-ion battery and critical minerals supply chain. Used by EV manufacturers, battery producers, mining companies, and global investors, BMI sets the price benchmarks that move markets.

But as the platform scaled, the product experience hadn't kept pace. Data was scattered across inconsistent interfaces, the visual language lacked cohesion, and the design had no shared foundation to build from. Analysts trusted the data, but the product didn't always feel like it deserved that trust.

MEGA MENU

Mega Menu: Less guessing, more finding.

Our old menu was minimal, perhaps too minimal. With a growing product suite spanning markets, data tools, events, and publications, a simple dropdown was no longer enough.

Enter the mega menu. A deliberate, organised layout that groups related content visually and contextually. Users can now see the full scope of Benchmark's offering at a glance, and navigate to exactly the right place, without the trial and error.

THE APP

The market in your pocket, introducing the Benchmark app

For an organisation that runs events worldwide and serves a global audience of analysts, executives, and policymakers, being mobile-ready isn't a nice-to-have. It's essential. Benchmark's users don't sit still, and neither should their access to the market.

This work covered two fronts: developing new features within the app, and designing the launch presentation page that introduces it to the world. The goal was to create a page that does justice to the product, clearly communicating that this isn't just a companion app, but a full intelligence hub. Prices, news, events, analysis, everything Benchmark delivers, now in your pocket.

The Benchmark App features

THE DESIGN SYSTEM

Julius 2.0, consistency as a foundation

Good design systems do more than organise components. They encode decisions, communicate intent, and make the right way to build things also the easiest way. Julius 2.0 was built with exactly that in mind.

Structured around four principles, Consistent, Scalable, Clean, and Easy, the system covers everything from typography and colour tokens to complex UI patterns. Fully documented and ready to use, it gives design and development a shared language that keeps Benchmark's product aligned across every touchpoint.

Every component in Julius 2.0 is fully documented, covering anatomy, states, variants, and do and don't usage guidelines. From behaviour specs to accessibility validation, each element is ready for a clean, confident developer handover.

THE MARKET COMPASS

Market Compass Contextual Navigation at Scale

Deep B2B platforms suffer from discovery friction. Users land on one market page and rarely find their way to adjacent opportunities. I designed the Market Compass as a persistent end-of-page component that mirrors the global architecture, letting users orient themselves within the full supply chain — from Energy & Grid to Battery Recycling — without returning to the top nav.

The tree structure creates spatial awareness, while the active state and tooltip cards reduce cognitive load and encourage cross-market exploration.

OUTCOMES

Where Design Met Business

Shipped to strong reception from both internal stakeholders and customers. Key metrics tracked across the first 90 days post-launch.

+38% Time on Site Market Compass and structured content hierarchy drove deeper engagement across market pages	-22% Bounce rate Intuitive market architecture reduced dead-end exits and encouraged onward navigation	+60% App download Designed app landing page drove iOS adoption in the first 90 days post-launch	+50% Dev time saved Julius eliminated rework and streamlined handoff with the external dev team
